Meltzer et al, "Chronological evidence fails to support claim on an isochronous widespread layer of cosmic impact indicators dated to 12,800 years ago", u *PNAS*, 12 May 2014. Od Alena Vesta sam dobio informaciju (mejl od Alena Vesta upućen autoru, od 18. marta 2015) da studija koja se, sa još

27 koautora, priprema kao odgovoru na napade od strane Melcera i sarad., nosi radni naslov “Bayesian chronological analyses consistent with synchronous age of 12,820–12,740 cal BP for Younger Dryas Boundary on Four Continents”, te da će uskoro biti podnesena na recenziju. U istom mejlu, Vest napominje kako postoji nešto što valja dodati u vezi s datiranjem, a što je već u štampi (18. marta 2015): „U sloju granice mlađeg drijasa, pronašli smo proksije koji ukazuju na visoke temperature, među kojima su nanodijamanti, iz grupe zamenskih podataka koji se nalaze u svim impaktnim događajima. Dokazi su široko rasprostranjeni – naši lokaliteti s granice mlađeg drijasa prostiru se u više od dvanaest zemalja, na četiri kontinenta (S. Amerika, J. Amerika, Evropa i Azija). U dvema studijama, Wittke et al i Kinzie et al izvestili su o dvanaest radiokarbonskih datiranja visoke rezolucije, koji u proseku daju starost od 12.800 ± 100 kalendarskih godina za sloj granice mlađeg drijasa. To znači da se, statistički, sloj granice mlađeg drijasa na svim tim lokalitetima mogao nataložiti istog dana – ne dokazuje da jeste, ali pokazuje da je moguće. Ipak, i pored toga što su ti rezultati dobijeni direktno na sloju granice mlađeg drijasa i što su statistički identični, Meltzer et al odbacili su ih pod izgovorom da nisu isti. Takvo odbacivanje je naprosto neodbranjivo.”

Zaključno s periodom pre 12.000 godina, više od pedeset odsto leda se vratilo u okean, a nivo mora je narastao na minus 60 metara.“ Pomenutih minus 100 metara, minus 80 metara i minus 60 metara su poređenje s današnjim nivoom mora. Prema tome, pre poplave koja je formirala Skabland na Kolumbijskoj visoravni, nivo mora je bio 100 metara niži nego danas, a nakon poplave je bio 60 metara niži nego danas, tj. došlo je do zapanjujućeg porasta od 40 metara. Slano more [Tijamat] je, s druge strane, okružavalo kopno. Abzu je bio carstvo i dom mudrog boga Enkija... Verovalo se da Enki boravi u abzuu još od pre stvaranja čovečanstva. Prema vavilonskom epu o stvaranju sveta [*Enuma Eliš*], Abzu je bilo ime prvo bitnog stvora, Tijamatinog ljubavnika; kad ga je Ea ubio, podigao je sebi dom na njegovom mrtvom telu i otada se Eino boravište naziva njegovim imenom...“ (Anne Draffkorn Kilmer, “The Mesopotamian Counterparts of the Biblical Nephilim”, in E.W. - ¹⁶¹ Rejmondova (*The Mythical Origin of the Egyptian Temple*, op. cit., p. 263) naposletku se odlučila za Sakaru kao svog vodećeg kandidata za „mesto severno od Memfisa“, gde se, prema verovanju, knjiga spustila s neba. Nije mi jasna logika tog njenog zaključka. Geografska širina Henen-nesuta je 29:08, Memfisa 29:84, Sakare 29:87, Velike piramide u Gizi 29:98, a Dašura 29:80. Što je ovaj broj veći, to je položaj severniji, zbog čega je očigledno da moramo isključiti Henen-nesut i Dašur: prvi je smešten za 0:76 stepena, a potonji za 0:04 stepena južno od Memfisa. Sakara leži severno od Memfisa, ali samo za 0:03 stepena – toliko blizu da se takoreći nalazi na istoj geografskoj širini. Nasuprot tome, Giza je smeštena za 0:14 stepena severnije od Memfisa i mnogo očiglednije ispunjava potreban uslov.

Sve te hipotetičke rupe za klinove-dizače morale bi se napraviti upravo na toj gornjoj strani, iznad centra mase. Kako tu nema nijedne takve rupe, na tom najvećem i najtežem od tri bloka, logično je prepostaviti da ih nema ni na ostala dva.

Dodao je: „U slučaju Plejada i Hijada, važno je imati na umu da Mesec za vreme svog 18,36 orbitalnog perioda može proći kroz oba ta rasejana zvezdana jata: ona se nalaze svega cca 5° daleko od ekliptike, što ukazuje na ekstremne tačke lunarnе orbite. Iz tog razloga se smatra da su ova dva zvezdana jata veoma važna i zato je ova 'kapija' jedinstvena.“
- ²⁸³ Orbitalna ravan Meseca nagnuta je prema ravni ekliptike za svega 5,1 stepeni. Njegovo kretanje je stoga ograničeno vrlo blizu ravni ekliptike i uvek unutar zodijačkih sazvežđa.

Vid. takođe Sir Walter Scott (Ed. and Trans.), *Hermetica: The Ancient Greek and Latin Writings which contain Religious or Philosophic Teachings attributed to Hermes Trismegistus*, Shambhala, Boston, 1993, p. 101. Opis Enoha kao „sedmog od Adama“ nalazi se u Judi 1:14. Vid. takođe Postanje 5:1-32, „Pleme Adamovo“. Deset nabrojanih patrijarha su Adam, Sit, Enos, Kajinan, Maleleilo, Jared, Enoh, Matusal, Lameh, Noje (<http://www.biblija.rs/download/biblija.pdf>). Ljudi često brkaju Enosa, trećeg patrijarha, sa sedmim patrijarhom Enohom. Međutim, Enosu se ne pripisuju nikakva posebna inteligencija, znanja ili osobine, dok je Enoh živeo „jednako po volji Božjoj“ (Postanje 5:24) i onda misteriozno iščezao sa zemlje: „.... nestade ga, jer ga uze Bog“ (Postanje, 5:24). Poslanica Jevrejima to elaborira (Jevrejima posl. 11:5): „Vjerom bi Enoh prenesen da ne vidi smrti; i ne nađe se, jer ga Bog premjesti, jer prije nego ga premjesti, dobi svjedočanstvo da ugodi Bogu.“
